

[METHOD FOR FAST INPUT OF CHINESE CHARACTER]

Abstract

A method for rapidly inputting a Chinese character in a mobile phone is provided. The method comprises: entering into a Chinese text editing status and receiving an input code; displaying a plurality of choices of the Chinese characters corresponding to the input code, the plurality of the choices of the Chinese characters being arranged in an order based on a usage frequency of each of the plurality of choices of the Chinese characters; selecting one Chinese character from the plurality of choices of the Chinese characters; and adjusting the usage frequency of the selected Chinese character. The method utilizes a data structure with a weighting value for each Chinese character so that during the input process, the usage frequency of each character is recorded. Hence, the method can expedite the users selection of the Chinese character with a higher usage frequency to attune to the users personal habit.
